Name	Facebook Link	Skills	Jobs	Phone Number	Tools
Age	Github Link	Programming Languages	Prices		
Location	LinkedIn Link	Resume DL Link			
Personal Interests	References				
Map of Countries I've Visited					
Photos of Myself					

Looking at the different versions of the sorts has given me an understanding of how users feel the chunks of content should be grouped.

The two additional sorts ended up being fairly alike to the initial sort I performed, but I felt some of the column names were more appropriate and thus used those when compiling the final sort. Both the “Personal Information” and “Contact Information” were nearly identical between all of the sorts with similar titles. Each person, while using different names for the categories, ended up with most of the content grouped in a similar fashion.

Starting with my initial sort, each person to perform the sort had one less category than the previous sort. At the end I believed that 5 was to few and 7 was to many, so I settled on 6 categories pulled from all three previous sorts.
